TITLE: Determination of zirconium and hafnium occurring together, on the basis of their catalytic effect

SOURCE: Zhurnal analiticheskoy khimii, v. 18, no. 7, 1963, 829-834

TOPIC TAGS: zirconium, hafnium, iodide oxidation, hydrogen peroxide, iodine, optical density, catalytic effect, analytical determination, zirconium-hafnium salt mixture, simultaneous determination, standard solution, calibration curve

ABSTRACT: Oxidation of an iodide ion by hydrogen peroxide in the presence of zirconium and hafnium salt catalysts in an acid medium has been studied 1) to establish the effect of pH on the oxidation rate, 2) to study the joint effect of both catalysts on this rate, and 3) to develop an analytical method for the determination of both elements simultaneously present in solution. The experiment was conducted either with pure HCl-acidified solutions of zirconium or hafnium salts, or with mixtures of the salts added to a mixture of potassium iodide and hydrogen peroxide solutions. The optical density of the iodine gradually evolving (in the presence of starch) indicated the reaction rate at any given time. The results were

Card 1/3

recorded automatically. The concentrations of the reactants were KI, 6×10^{-4} M; H_2O_2, 6×10^{-4} M; starch, 0.004%; Zr, 0.1×10^{-5}—1.0×10^{-5} M; and Hf, 0.1×10^{-5}—1.0×10^{-5} M. The pH was 0.4—2.8. All experiments were conducted at 25.0 ±0.1C. The results were obtained as straight-line plots of time versus optical density; plots of the slopes (tan α) (i.e., reaction rate) versus pH revealed maxima at pH 1—1.1 for zirconium salt solutions, and pH 2.1—2.2 for hafnium. Further analysis of the data, which took into account the concentrations of all possible particles, i.e., ions of partially or totally hydrolyzed zirconium or hafnium salt, hydroxyl complex ions such as $Zr(OH)^{3+}$, etc., indicated that the $Zr(OH)_5^+$ and presumably $Hf(OH)_5^+$ ions seem to be the catalytically active particles and that their maximum concentrations are at pH 1.1 and 2.1—2.2, respectively. The additive effect of the catalysts when present together was established by determining the linear analytical function proportional to their total concentrations, C_{Zr} or C_{Hf}:

$$k_2' \tan \alpha - k_2 \tan' \alpha = (k_2 k_1' - k_1 k_2') C_{Zr}$$

$$k_1 \tan' \alpha - k_1' \tan \alpha = (k_2' k_1 - k_1' k_2) C_{Hf}.$$

Mathematical analysis of the reaction kinetics established four constants for Zr and Hf at pH 1.1 and 2.2, respectively: k_1, 0.913 ±0.066 x 10^5; k_1', 0.106 ± 0.007 x 10^5; k_2, 0.943 ±0.43 x 10^5; k_2', 2.16 ±0.13 x 10^5. Fluctuations in the values

L 13803-63

ACCESSION NR: AP3003758

are caused by possible differences in solution concentrations and reaction conditions. The difference in catalytic effect was used in an analytical method for approximate determination of small concentrations of Zr and Hf simultaneously present in solution. The four constants are determined in each case, after which calibration curves of the analytical function depending on tan α at both pH values and including all four constants are plotted separately for several standard concentrations of Zr and Hf (see Figs. 1 and 2 of the Enclosure). After determining tan α at pH 1.1 and 2.2 for the unknown mixture, the sought concentrations are determined graphically. The mean error of the method is ±15%. The absence of systematic error confirms the additive nature of the catalytic effect. Orig. art. has: 4 figures, 2 tables, and 12 formulas.

TITLE: Quantitative determination of tantalum by its catalytic action on the oxidation of thiosulfate by hydrogen peroxide.

SOURCE: Zhurnal analiticheskoy khimii, v. 19, no. 6, 1964, 705-708

TOPIC TAGS: tantalum, quantitative determination, thiosulfate oxidation, catalysed thiosulfate oxidation, kinetic analysis, phototurbidimetric determination, catalysed oxidation

ABSTRACT: A new kinetic method is suggested for the quantitative determination of Ta (V), based on the catalysis of the reaction between thiosulfate and hydrogen peroxide:

$$4H_2O_2 + S_2O_3^{2-} \rightarrow 2SO_4^{2-} + 2H^+ + 3H_2O. \quad (1)$$

Since the rate of sulfate formation is proportional to the catalyst concentration, and since the optical density of $BaSO_4$ is directly proportional to the sulfate ion

Card 1/3

ACCESSION NR: AP4040669

concentration, phototurbidimetric determination in the changes of the optical density of $BaSO_4$ will indicate the rate of the indicated reaction. A linear relationship was found between catalyst concentration (i.e., sulfate formation) and length of the induction period (time from mixing of the reagents to moment optical density = 0.05). The relationships between induction period and peroxide and thiosulfate concentrations were also established (figs. 1, 2). It is suggested that concentrations of these corresponding to the middle portions of these curves be used. W, Ti, V and Th ions, which themselves catalyse the above reaction, and fluoride ions which form strong complexes with the catalyst affect the determination. Orig. art. has: 2 tables, 3 figures and 2 equations.

TITLE: Kinetic method for determining microquantities of molybdenum

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 8, 1965, 815-819

TOPIC TAGS: molybdenum, trace analysis, oxidation kinetics

ABSTRACT: A new kinetic method for determining trace amounts of molybdenum based on a catalytic acceleration of the oxidation of 1-naphthylamine by bromate has been developed. Vanadium, which catalyzes this reaction at concentrations of the order of 10^{-8} mol/l, interfers with the determination. Bromide, which accelerates the reaction, interferes at concentrations exceeding 10^{-5} mol/l. Tungsten, iron, and copper do not interfere even when present in amounts ten times that of molybdenum. Other oxidants interfere at concentrations greater than 10^{-5} mol/l. The sensitivity of the method is 0.005 µg of molybdenum in 25 ml of solution. Orig. art. has: 3 figures, 2 tables, 6 formulas.

TOPIC TAGS: rhenium, ~~trace analysis~~, oxidation kinetics, chlorate, iodide, zinc alloy

ABSTRACT: A reaction involving oxidation of iodide ions by chlorate ions was used to develop a simple and rapid kinetic method of determining rhenium in amounts from $5 \cdot 10^{-9}$ to $5 \cdot 10^{-8}$ mol/l. Potassium perrhenate solutions containing sulfuric acid were reduced with zinc amalgam to obtain Re in an oxidation state of 2, and the reduced rhenium salt, acting as a catalyst, accelerated the rate of the oxidation reaction. The rhenium content was determined from the extent of this catalytic effect. The sensitivity of the method is $9 \cdot 10^{-3}$ μg Re/ml. $CoSO_4$, $NiSO_4$, $CuSO_4$, $MnSO_4$, $ZnSO_4$, and $K_2Cr_2O_7$ do not interfere while products of the reduction of

Title : The Cherry (Prunus Cerasus) Saw Fly and Measures for Its Control Under the Conditions of the Kurgan Oblast

Orig Pub : Sb. nauchn. rabot. Kurgansk. s.-kh. in-t, 1956, vyp. 3, 130-135

Abstract : Brief data are given as to the biology of Neurotoma nemoralis. In field experiments in 1955-1956, the first treatment during the opening of the cherry buds with 12% hexachlorocyclohexane dust, the second with a 5-6% suspension of 5% DDT dust during the emergence of the saw fly, and the third treatment at the end of the flowering with a 5% DDT dust, almost completely exterminated the saw fly..

TITLE: A New Smelting Technology Under White Slag for Ball Bearing Steel of Grade ShKh15 (ShKh15)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. - Chernaya metallurgiya, 1960, No. 8, pp. 38 - 47

TEXT: At the "Dneprospetsstal" Works up to 1956 ShKh15 steel was treated simultaneously with slag and no attention was paid to steel treatment by slag in the ladle during the teeming. The final S content of 0.026 was satisfactory and the refining took between 2 h 10 min and 2 h 40 min or more. The refining time had been cut down to 1 h 50 min - 2 h 10 min by addition of ferrochrome into the reduced metal with a content of 0.025% S. To boost the heat process and to improve the metal quality, N.M. Chuyko suggested to cut the refining time to 1 h 10 min or less by deoxidation and desulfuration of the metal with electric furnace slag in the ladle during teeming. The article contains details of this new

Card 1/3

technique. The effect of the oxidizing and reducing heat period factors was determined. The formation of highly-basic and well deoxidized slag was mainly studied. The slag quantity used was 4 - 5% of the metal weight with a CaO content of over 55%, FeO below 0.5% and CaF_2 below 2.0%. First a considerable quantity of slag was spilled through a widely open hole into the ladle, and then metal poured from 3 - 4 m height in a solid jet, which brought about a large contact area with slag and rapid deoxidation and desulfuration. The optimum parameters of the oxidation period were stated to be: C(%) = 0.3 - 0.5%, at a carbon burning rate of 0.4 - 0.5%/h, and a metal temperature of 1,545 - 1,565°C before skimming the oxidizing slag. The reducing period under lime-electric white slag with low calcium fluoride content proved to be expedient, as well as the treatment of the metal in the ladle by this slag. The optimum slag composition is: (FeO)<0.5%; (CaF_2) = 1 - 2%; $\Sigma(SiO_2 + Al_2O_3)$ = 31 - 34%; (CaO)>55%; (MgO)<2.5%, and $\Sigma(CaO + MgO)$ = 63 - 65%. The optimum metal temperature before teeming is 1,550 - 1,570°C; it ensures the filling of a 2.8-ton ingot during 145 - 190 sec. Final deoxidation of steel by aluminum in the ladle gives a high reduction of oxygen content (over 30%). The quantity of nonmetallic inclusions in

Card 2/3

steel was slightly lower than usual in steel smelted in the usual process under carbide slag with long refining. There are 7 figures, 5 tables and 7 Soviet references.

TITLE: Annual general meeting of the BSSR Academy of Sciences

SOURCE: AN BSSR. Izvestiya. Seriya fiziko-tekhnicheskikh nauk, no. 1, 1965, 133-136

TOPIC TAGS: academic institution, academic personnel, scientific conference

ABSTRACT: The meeting was held on 25-27 February, 1965. In the introductory address, the president of the BSSR Academy of Sciences, V. P. Kuprevich, summarized the past year's activity, which concerned work dealing with the national economy and theoretical investigations on photosynthesis, solid state, semiconductors, and general physics and chemistry. He also discussed the relation between the activities of the SSSR and BSSR Academies.

Academician BSSR F. P. Vinokurov, Chief Scientific Secretary of AN BSSR Presidium, reported on the scientific-organizational activities of AN BSSR in 1965, covering the projects of the various institutes:

The Physics Institute engaged in several studies on the theory of lasers and the use of powerful light pulses in connection with ultrarapid spectral registra-

Card 1/4

tion, which made it possible to disclose the formation of triplet states and stages in the formation of photoreducing forms of chlorophyll and its analogs.

The Heat- and Mass-Exchange Institute developed a theory of high-intensity non-equilibrium heat and mass exchange processes with account of finite transport rates, and a theory of turbulent heat and mass exchange under stationary conditions in the interaction between a capillary-porous body with a gas stream. A new method of heat treatment of capillary porous moist materials was developed. Self-similar solutions were obtained for boundary-layer problems.

The Mathematics and Computation Institute developed algorithms and programs for machine design and for production planning.

The Earth Physics Sector investigated the properties of the earth's crust in Belorussia.

Reports were received also from the Institutes and Divisions: History, Philosophy, Polymer Mechanics, Biology, Experimental Botany and Microbiology, Genetics and Cytology, and General and Inorganic Chemistry.

The staff of the Academy includes 4025 persons, of which 3043 are in the budgetary establishments and 474 in the administrative staff. The scientific person-

nel numbers 1621 persons, including 52 with the degree of Doctor of Science and 404 Candidates of Science, 50 Academicians, and 36 Corresponding Members. Other statistics dealing with dissertations and publications are also included.

Papers on the most outstanding scientific activities of 1964 were delivered by T. S. Gorbunov, N. D. Nesterovich, N. F. Yermolenko, F. I. Fedorov, and A. K. Krasin. Participating in the discussions were BSSR Academicians G. V. Bogomolov, V. P. Severdenko, N. N. Sirota, B. B. Yerofeyev, I. A. Bulygin, N. A. Dorozhkin, A. N. Sevchenko, N. P. Yerugin, and P. P. Rogovoy, Corresponding Member N. V. Kamenskaya, Doctor of Tech. Sciences Ye. G. Konovalov and G. K. Goranskiy, and Candidate of Chemical Sciences S. V. Markevich.

N. V. Kamenskaya was appointed director of the Institute of History.

Scientific papers were delivered at the General Meetings by Academician K. I. Lukashev (Problems of Oil and Gas Resources of BSSR), Academician A. K. Krasin (Present Status of Development of Atomic Energy), and Academician N. V. Turbin (Some Problems in Molecular Genetics).

3358. OPERATION OF DONBASS CUTTER-LOADERS ON DIPPING SEAMS IN COMBINATION WITH DON UDI SINGLE FLANGE PLATES. Yatskikh, V.G. (Ugol (Coal), Dec. 1953, 39-42). An illustrated description is given of a cutter-loader working in a seam which dips at 28-30°. A series of overlapping steel places on the floor, each with a vertical flange at the edge opposite to the coal face, forms a conveying trough between the last row of props and the face for the supply of new timber from the top and the discharge of cut coal to the bottom of the slope.
